

## Wimmera Mallee Pipeline Project Supply System 1 & 7, VIC

- Client Grampians Wimmera Mallee Water
- Year Constructed 2006/2007

The Wimmera Mallee Pipeline Project is the largest water distribution project in Australia's history. The Pipeline System will supply 9,000 rural properties and 36 towns over an area of two million hectares, enabling sustainable management of water resources for the large agricultural region of Western Victoria.

The initial proposal was for all 7 Supply Systems to be completed over a 10 year time frame. Due to the continuing drought conditions and regional water storage capacities dropping below 10% for several years, the project has been fast tracked and will be completed within four years.

Out of the 7 Supply Systems, Mitchell Water Australia was awarded 5 of the contracts being SS1, SS2, SS3, SS4 & SS7.

The projects have had many challenges to overcome with major river crossings, a large number of cultural heritage sites and thousands of landholders with whom to liaise. All these challenges were managed with great success and received commendations from the Department of Primary Industries, the local Land Councils and the client.

The scope of works for Supply System 1 & 7 included design and construction of:

- approx 1,400km of MSCL & PVC pipelines ranging from 1,016mm to 50mm
- 9 pump stations
- 8 water storage tanks
- 4 earthen storages
